

Les différentes échelles  
The different scales

Scale: The proportion that the model bears to the full size prototype - can be expressed either as size relationship (1":1ft) or a ratio (1:12, 1/12).

Gauge: The distance between the rails - generally inside rail to inside rail.

Échelle: La proportion entre le modèle réel et le modèle miniature

S'exprime sous forme de relation (1":1 pied) ou un ratio (1:12 ou 1/12)

Écartement: La distance entre les deux rails, mesurée de l'intérieur d'un rail à l'intérieur de l'autre rail.

70	EM	Britain	18mm	4mm:1ft, 1:76.2	trade, a new OO scale association has recently been formed to define standards. (Eighteen Millimetre)
71	EM	Britain	18.2mm	4mm:1ft, 1:76.2	Revised standard
72	EEM	Britain	18.83mm	4mm:1ft, 1:76.2	A temporary step in the evolution of P4, has long been obsolete
73	P4	Britain	18.82mm	4mm:1ft, 1:76.2	P4 or Protofour was a radical rethink created by scaling down from the prototype and increasing tolerances by the minimum necessary for practical production of components. It created quite a stir in 1966/67 but is now very well established. P4 standards are also used for modelling Irish Railways broad and Narrow gauges, using 21mm and 12mm gauges. And for modelling the GWR Broad gauge using 28mm gauge
74	S4	Britain	18.82mm	4mm:1ft, 1:76.2	Exact scale flangeways too, made possible by additional effort to reduce the production tolerances built into P4 standards
